EXAMINER

MILLER, MICHAEL G

ART UNIT

PAPER NUMBER

1792

NOTIFICATION DATE

DELIVERY MODE

06/26/2009

ELECTRONIC

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Notice of the Office communication was sent electronically on above-indicated "Notification Date" to the following e-mail address(es):

mailroom@bskb.com

Office Action Summary	Application No. 10/538,079	Applicant(s) MATSUMOTO ET AL.	
	Examiner MICHAEL G. MILLER	Art Unit 1792	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 05 March 2009.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-6 and 8-10 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-6,8-10 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Continued Examination Under 37 CFR 1.114

- 1) A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 06 JAN 2009 has been entered.

Response to Amendment

- 2) Examiner notes the amendments filed on 06 JAN 2009 and 04 JUN 2009. The amendment2 introduces no new matter and are therefore accepted. As a result of the amendment Claim 1 is amended and Claim 7 is canceled.

Response to Arguments

- 3) Applicant's arguments filed 06 JAN 2009 and 04 JUN 2009 have been fully considered but they are not persuasive. The later-filed arguments cover all arguments presented in the earlier-filed amendment; as such Examiner will refer to the 04 JUN 2009 arguments in the following discussion.

Art Unit: 1792

- 4) Examiner points out that all arguments with regards to temperature are countered by Isozaki at Column 4 Lines 59-67; the taught range of 20 - 70 degrees Celsius overlaps the claimed range of 55 - 85 degrees Celsius.
- 5) Applicant's first argument is that neither Isozaki nor Starzewski, alone or in combination, teach the invention as claimed. As the rejection is made over a combination of references, Examiner will address the combination. As discussed in the previous Office Action, Isozaki teaches dipping a PVA film on which iodine is adsorbed and oriented into an aqueous solution containing boric acid (Column 6 Lines 38-50). Isozaki does not teach suppressing contact between the aqueous solution and oxygen. Isozaki does teach that a heat treatment may be performed after dipping and that oxidation can occur during heat treatments which can discolor the film and as such, oxygen should be excluded from the heat-treating step (Column 4 Lines 1-12 and 59-67). Starzewski teaches that a heat treatment performed after the fixing step can improve the polarization properties of a PVA film and that this treatment should be conducted in the absence of oxygen (Column 2 Lines 4-7 and Column 4 Line 66 – Column 4 Line 31). The motivation to combine these teachings is that both teachings want to produce a PVA film with polarization properties and Starzewski teaches a method that improves said polarization properties. At this point, it is known to suppress oxygen contact with the PVA film before and after dipping to avoid deleterious effects to the PVA film. It would have been obvious to a person having ordinary skill in the art at the time the invention was made to suppress oxygen contact with the aqueous solution during the dipping

Art Unit: 1792

phase, because if oxygen enters the aqueous solution and contacts the film during dipping it can be entrained into the post-fixing heating phase which would cause the aforementioned deleterious effects. DesMarais and Dempo are not required to cure the deficiency of no motivation to combine, because the motivation is found in Isozaki and Starzewski as discussed above.

- 6) Isozaki teaches the claimed weight ratio at Column 6 Lines 38-51.

Claim Rejections - 35 USC § 103

- 7) The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

- 8) The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148

USPQ 459 (1966), that are applied for establishing a background for determining

obviousness under 35 U.S.C. 103(a) are summarized as follows:

- (1) Determining the scope and contents of the prior art.
- (2) Ascertaining the differences between the prior art and the claims at issue.
- (3) Resolving the level of ordinary skill in the pertinent art.
- (4) Considering objective evidence present in the application indicating obviousness or nonobviousness.

- 9) This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the

Art Unit: 1792

various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

10) Claims 1-3, 5, and 8-10 are rejected under 35 U.S.C. 103(a) as being unpatentable over Isozaki (U.S. Patent 6,337,369, hereinafter '369) in view of Starzewski (U.S. Patent 5,670,092, hereinafter '092).

11) With regard to Claim 1, '369 teaches a method for producing a polarizing film comprising:

- a) The step of dipping a polyvinyl alcohol film in/on which iodine is adsorbed and oriented in an aqueous solution containing boric acid at a temperature of 55 – 85 degrees Celsius ('369 Column 6 Lines 38-50 and Column 4 Lines 59-67).
- b) A weight ratio of water : boric acid : potassium iodide in said aqueous solution containing boric acid is 100 : (2 – 15) : (2 - 20) ('369 Column 6 Lines 38 – 51 teaches 100 : 2 : 4).
- c) '369 is silent as to the limitation wherein contact between the aqueous solution and oxygen is suppressed.
- d) '369 teaches that for PVA dry-stretching, an oxygen-poor atmosphere is desirable to prevent discoloration of the PVA (Column 4 Lines 1-12) and that a heat treatment may be conducted after the fixing step (Column 4 Lines 59 - 67).

Art Unit: 1792

- e) '092 teaches that a post-fixing heat treatment improves the polarization properties of the PVA film when performed in the absence of oxygen. (Column 2 Lines 4-7, Column 3 Line 66 – Column 4 Line 31).
- f) Therefore, it would have been obvious to a person having ordinary skill in the art at the time the invention was made to have combined the method of '369 with the post-treatment step of '092 because '369 wants to create a polarizing film and '092 teaches a way to improve the optical properties of a polarizing film.
- g) '369/'092 discloses the claimed invention except for wanting to suppress contact between the aqueous solution and oxygen. It would have been obvious to one having ordinary skill in the art at the time the invention was made to perform this suppression since it was known in the art that oxygen produces deleterious effects in the processing steps immediately surrounding it (discoloration in the stretching step, impaired polarization in the heat treatment step).

12) With regard to Claim 2, '369/'092 teaches the method according to claim 1, except for the following limitation:

- a) The contact between said aqueous solution containing boric acid and oxygen is suppressed by adjusting an oxygen concentration in an atmosphere which is in contact with said aqueous solution to 5% by volume or less.
- b) Both '369 and '092 teach using nitrogen atmospheres to exclude oxygen during the dry stretching and heat treatment respectively. There would be a reasonable expectation of success of excluding oxygen from contact with the aqueous solution if a nitrogen atmosphere were kept over the aqueous solution. The

Art Unit: 1792

degree of exclusion is a result-effective variable and as such is held to be routine experimentation.

13) Claim 3 is duly rejected on the same grounds as Claim 2, as Claim 3 calls for the method of either Claim 1 or Claim 2 wherein the exclusion is performed using an inert gas (nitrogen taught above).

14) Claim 5 is rejected on the same grounds as Claim 3, as it requires the method of Claim 3 wherein the inactive gas is nitrogen.

15) With regard to Claim 8, '369/'092 teaches the method according to claim 1, wherein:

- a) A dipping time is from 90 to 1,200 seconds ('369 Column 6 Lines 38-51, 240s).
- b) '369 teaches a temperature of 30°C for the aqueous solution which is below the claimed temperature of 50 to 85°C.
- c) '369/'092 discloses the claimed invention except for the specific temperature of the fixing bath. It would have been obvious to a person having ordinary skill in the art at the time the invention was made to adjust the temperature of the bath, since it has been held that where the general conditions of a claim are disclosed in the prior art, discovering the optimum or workable ranges involves only routine skill in the art. *In re Aller*, 220 F.2d 454, 105 USPQ 223 (CCPA 1955).

16) With regard to Claim 9, '369/'092 teaches the method according to claim 1, wherein said polyvinyl alcohol film has a polymerization degree of 1,500 to 5,000 ('369 Column 6 Lines 38-51, 4000).

17) With regard to Claim 10, '369/'092 teaches the method according to claim 1, wherein said polyvinyl alcohol film in/on which iodine is adsorbed and oriented is a film

Art Unit: 1792

produced by dipping an unstretched polyvinyl alcohol film in a solution containing iodine and potassium iodide and then uniaxially stretching it ('369 Column 6 Lines 38-51).

18) Claim 4 is rejected under 35 U.S.C. 103(a) as being unpatentable over '369/'092 as applied to claim 3 above, and further in view of DesMarais et al (U.S. Patent 6,362,244, hereinafter '244).

19) With regard to Claim 4, '369/'092 teaches the method according to claim 3 except for the following limitation:

- a) Wherein the dipping of said polyvinyl alcohol film in said aqueous solution containing boric acid is carried out while bubbling said inactive gas in said aqueous solution.
- b) As shown above, '369/'092 has motivations to remove oxygen from the processing system. It known in nature that aqueous solutions can carry dissolved gases, including oxygen.
- c) '244 teaches that deoxygenation of a liquid is known and that is usually performed by sparging a liquid with nitrogen or argon (Column 5 Lines 1-5).
- d) Therefore, it would have been obvious to a person having ordinary skill in the art at the time the invention was made because '369/'092 wants to make a polarizing film in a low-oxygen environment and '244 teaches that one way to remove oxygen from a liquid system is to bubble an inert gas through the system.

Art Unit: 1792

20) Claim 6 is rejected under 35 U.S.C. 103(a) as being unpatentable over '369/'092 as applied to claim 1 above, and further in view of Dempo (U.S. Patent 5,512,178, hereinafter '178).

21) With regard to Claim 6, '700 teaches the method according to claim 1, except for the following limitation:

- a) Wherein said polyvinyl alcohol film is dipped in said aqueous solution containing boric acid while said aqueous solution is treated with activated carbon continuously or intermittently.
- b) As shown above, '369/'092 has motivations to remove oxygen from the processing system. It is known in nature that aqueous solutions can carry dissolved gases, including oxygen, as well as other oxidizing materials.
- c) '178 teaches that an activated carbon filter can be used to remove oxidizing substances from an aqueous solution (Column 3 Lines 34 – 48). Oxygen is the prototypical oxidizing substance in nature.
- d) Therefore, it would have been obvious to a person having ordinary skill in the art at the time the invention was made because '369/'092 wants to make a polarizing film in a low-oxygen environment and '178 teaches that one way to remove oxygen from a liquid system is to bubble pass the liquid through an activated carbon filter.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to MICHAEL G. MILLER whose telephone number is (571)270-1861. The examiner can normally be reached on M-F 7-4.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Michael Cleveland can be reached on (571) 272-1418. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
